

BAFF RECEPTOR (BCMA), AN IMMUNOREGULATORY AGENT
RELATED APPLICATIONS

This is a continuation-in-part of PCT/US00/22507, filed on August 16, 2000, which
5 claims priority from U.S. provisional application Serial No. 60/149,378 filed on August 17,
1999, U.S. provisional application Serial No. 60/181,684 filed on February 11, 2000 and
U.S. provisional application Serial No. 60/183,536 filed on February 18, 2000.

FIELD OF THE INVENTION

10 The present invention relates to the use of a receptor to BAFF, a β -cell activating factor belonging to the Tumor Necrosis Factor ("TNF") family, and its blocking agents to either stimulate or inhibit the expression of B-cells and immunoglobulins. This receptor has anti-cancer and immunoregulatory applications as well as uses for the treatment of immunosuppressive disorders such as HIV. In addition, the receptor and its blocking
15 agents play a role in the development of hypertension and its related disorders. Furthermore, cells transfected with the gene for this receptor may be used in gene therapy to treat tumors, lymphomas, autoimmune diseases or inherited genetic disorders involving B-cells. Blocking agents, such as recombinant variants or antibodies specific to the receptor, have immunoregulatory applications as well. Use of the receptor to BAFF as a
20 B-cell stimulator for immune suppressed diseases including for example uses for patients undergoing organ transplantation (e.g., bone marrow transplant) as well as recovering from cancer treatments to stimulate production of B cells are contemplated. Use of the receptor to BAFF as an adjuvant and or costimulator to boost and/or restore B cell levels to approximately normal levels are also contemplated. Soluble forms of the receptor to
25 BAFF that block B cell function may also be used to inhibit B-cell mediated diseases.

BACKGROUND OF THE INVENTION

The present invention relates to a novel receptor in the TNF family. A novel receptor has been identified, BAFF-R (or "BCMA").

The TNF family consists of pairs of ligands and their specific receptors referred to
30 as TNF family ligands and TNF family receptors (Bazzoni and Beutler, 1996). The family is involved in the regulation of the immune system and possibly other non-immunological systems. The regulation is often at a "master switch" level such that TNF family signaling

can result in a large number of subsequent events best typified by TNF. TNF can initiate the general protective inflammatory response of an organism to foreign invasion that involves the altered display of adhesion molecules involved in cell trafficking, chemokine production to drive specific cells into specific compartments, and the priming of various 5 effector cells. As such, the regulation of these pathways has clinical potential.

Induction of various cellular responses mediated by such TNF family cytokines is believed to be initiated by their binding to specific cell receptors. At least two distinct TNF receptors of approximately 55 kDa (TNFR1) and 75 kDa (TNFR2) have been identified [Hohman et al., J. Biol. Chem. 264: 14927-14934 (1989) and Brockhaus et al., PNAS, 87: 10 3127-3131 (1990)]. Extensive polymorphisms have been associated with both TNF receptor genes. Both TNFRs share the typical structure of cell surface receptors including extracellular, transmembrane and intracellular domains. The extracellular portion of type 1 and type 2 TNFRs contains a repetitive amino acid sequence pattern of four cysteine rich domains (CDRs). A similar repetitive pattern of CDRs exist in several other cell surface 15 proteins, including p75 nerve growth factor receptor, the B-cell antigen CD40 amongst others.

The receptors are powerful tools to elucidate biological pathways because of their easy conversion to immunoglobulin fusion proteins. These dimeric soluble receptor forms are good inhibitors of events mediated by either secreted or surface bound ligands. By 20 binding to these ligands they prevent the ligand from interacting with cell associated receptors that can signal. Not only are these receptor-Ig fusion proteins useful in an experimental sense, but they have been successfully used clinically in the case of TNF-R-Ig to treat inflammatory bowel disease, rheumatoid arthritis and the acute clinical syndrome accompanying OKT3 administration (Eason et al., 1996; Feldmann et al., 1996; 25 van Dullemen et al., 1995). One can envision that manipulation of the many events mediated by signaling through the TNF family of receptors will have wide application in the treatment of immune based diseases and also the wide range of human diseases that have pathological sequelae due to immune system involvement. A soluble form of a recently described receptor, osteoprotegerin, can block the loss of bone mass and, 30 therefore, the events controlled by TNF family receptor signaling are not necessarily limited to immune system regulation. Antibodies to the receptor can block ligand binding

and hence can also have clinical application. Such antibodies are often very long-lived and may have advantages over soluble receptor-Ig fusion proteins which have shorter blood half-lives.

While inhibition of the receptor mediated pathway represents the most exploited therapeutic application of these receptors, originally it was the activation of the TNF receptors that showed clinical promise (Aggarwal and Natarajan, 1996). Activation of the TNF receptors can initiate cell death in the target cell and hence the application to tumors was and still is attractive (Eggermont et al., 1996). The receptor can be activated either by administration of the ligand, i.e. the natural pathway or some antibodies that can crosslink the receptor are also potent agonists. Antibodies would have an advantage in oncology since they can persist in the blood for long periods whereas the ligands generally have short lifespans in the blood. As many of these receptors may be expressed more selectively in tumors or they may only signal cell death or differentiation in tumors, agonist antibodies could be good weapons in the treatment of cancer. Likewise, many positive immunological events are mediated via the TNF family receptors, e.g. host inflammatory reactions, antibody production etc. and therefore agonistic antibodies could have beneficial effects in other, non-oncological applications.

Paradoxically, the inhibition of a pathway may have clinical benefit in the treatment of tumors. For example the Fas ligand is expressed by some tumors and this expression can lead to the death of Fas positive lymphocytes thus facilitating the ability of the tumor to evade the immune system. In this case, inhibition of the Fas system could then allow the immune system to react to the tumor in other ways now that access is possible (Green and Ware, 1997).

SUMMARY OF THE INVENTION

Applicants have identified a cDNA clone that encodes a polypeptide, designated in the present application as "BAFF-R" or as "BCMA", that binds the tumor necrosis factor, BAFF, a B-cell activating factor belonging to the Tumor Necrosis Factor ("TNF") family. BAFF is the same molecule previously described in WO/9912964, which is incorporated by reference herein.

In one embodiment, the invention provides methods of using BAFF-R. Included in such methods are methods of inhibiting B-cell growth, dendritic cell-induced B-cell

growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide. Also included are methods of stimulating B-cell growth, dendritic cell-induced B-cell growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide or co-stimulating B-cell growth, dendritic cell-induced B-cell growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide and an anti-T antibody, a CD40 ligand or an anti-CD40 ligand.

In another embodiment, the invention provides methods of using BAFF-R in the treatment of autoimmune diseases, hypertension, cardiovascular disorders, renal disorders, B-cell lympho-proliferate disorders, immunosuppressive diseases, organ transplantation, and HIV. Also included are methods of using agents for treating, suppressing or altering an immune response involving a signaling pathway between BAFF-R and its ligand, and methods of inhibiting inflammation by administering an antibody specific for a BAFF-R or an epitope thereof.

The methods of the present invention are preferably carried out by administering a therapeutically effective amount of a BAFF-R polypeptide, a chimeric molecule comprising a BAFF-R polypeptide fused to a heterologous amino acid sequence, or an anti-BAFF-R antibody homolog.

In one embodiment, the invention provides pharmaceutical compositions comprising a BAFF-R polypeptide and a pharmaceutically acceptable excipient.

In another embodiment, the invention provides chimeric molecules comprising BAFF-R polypeptide fused to a heterologous polypeptide or amino acid sequence. An example of such a chimeric molecule comprises a BAFF-R fused to a Fc region of an immunoglobulin or an epitope tag sequence.

In another embodiment, the invention provides an antibody that specifically binds to a BAFF-R polypeptide. Optionally, the antibody is a monoclonal antibody.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows the nucleic acid sequence (SEQ ID NO:2) of a cDNA for human BAFF-R (BCMA) and its derived amino acid sequence (SEQ ID NO:1). Potential start of translation at either nucleic acid residue 219 or 228; cysteine rich domain (CRD) at nucleic acid residues 240-341 of SEQ ID NO: 2 (amino acid residues 8-41 of SEQ ID NO:1); and potential transmembrane region at nucleic acid residues 375-459 of SEQ ID NO:2.

Figure 2 shows the nucleic acid sequence (SEQ ID NO: 4) and its derived amino acid sequence (SEQ ID NO:3) of pJST538, a plasmid encoding BAFF-R-Fc: nucleic acid residues 1-69, murine IgG-kappa signal sequence; nucleic acid residues 70-222, BAFF-R (nucleic acid residues 1-153); nucleic acid residues 223-906, human IgG.

Figure 3 shows the nucleic acid sequence of pJST535, a plasmid encoding a full length human BAFF-R and its derived amino acid sequence.

Figure 4 shows a structure comparison between TNF-R55 and BAFF-R.

Figure 5 shows 293EBNA cells transfected with either (a)CH269 (1.0ug) or (b)pJST535 (0.1ug), the plasmid expressing full length BAFF-R, and stained with 0.5ug/ml flag-hBAFF in the plate assay format.

Figure 6(a) shows FACS overlay of 293EBNA transfected with pJST535 and stained as follows: no ligand (black histogram), 1ug/ml flag-hCD40L (pink) or flag-hBAFF (green). All samples were then stained with anti-flag M2 followed by donkey anti-mouse IgG as described in methods in Example 2.

Figure 6(b) shows FACS histograms with statistics of same experiment. Staining is as follows: (1)unstained, (2) 7AAD only, (3) 2nd step and 7AAD only, (4) 9ug/ml flag-hBAFF, (5) 3ug/ml flag-hBAFF , (6) 1ug/ml flag-hBAFF, (7) 0.33ug/ml flag-hBAFF, (8) 0.11 ug/ml flag-hBAFF, (9)flag-hCD40L 1ug/ml.

Figure 7 shows immunoprecipitations with BAFF-R-Fc as described in methods in Example 4. Molecular weight standards in kDa are as labeled to the left of the figure. Lane (1) 12.5 ng flag-hTWEAK, (2) 12.5 ng flag-hBAFF, (3) immunoprecipitation of flag-hBAFF by 0.5ml BAFF-R-Fc conditioned media, (4) immunoprecipitation of flag-hTWEAK by 0.5ml BAFF-R-Fc conditioned media, (5) immunoprecipitation of no ligand by 0.5ml BAFF-R-Fc conditioned media, (6) immunoprecipitation of flag-hBAFF by

0.5ml conditioned media from untransfected 293EBNA, (7) immunoprecipitation of flag-hTWEAK by 0.5ml conditioned media from untransfected 293EBNA.

Figure 8 shows a plot of the results of a splenocyte proliferation assay in which the counts per minute (CPM) incorporated into mouse splenocyte cells is plotted against the 5 amount of human BAFF added (ug/ml).

Figure 9 shows a plot of the results of a BAFF blocking assay analyzing BAFF binding to Raji cells in which the MFI (mean fluorescence intensity) readings are plotted against the amount of R:hIgG1 (ng/ml).

Figure 10(a) shows plots of expression of IgM vs. CD1 in a FACS analysis for Baff 10 Tg mice that received h-Ig (middle panel) or hBCMA-Ig (lower panel) and for wildtype littermate controls that received PBS injections (upper panel), as described in Example 11.

Figure 10(b) shows plots of the expression of CD21 vs. IgM in FACS analysis by 15 gating on IgD positive populations for Baff Tg mice that received h-Ig (middle panel) or hBCMA-Ig (lower panel) and for wildtype littermate controls that received PBS injections (upper panel), as described in Example 11.

Figure 10(c) shows plots of the expression of CD21 vs. IgM in FACS analysis by gating on IgD negative populations for Baff Tg mice that received h-Ig (middle panel) or hBCMA-Ig (lower panel) and for wildtype littermate controls that received PBS injections (upper panel), as described in Example 11.

Figure 11 shows spleen weights for all groups of Baff Tg mice (given as weight in 20 mg +/- standard deviation).

Figure 12 shows a plot of proteinurea (mg/dL) vs. injection number for Baff Tg mice treated with PBS, hIg, hBCMA-Ig and for littermate controls.

Figure 13 shows a plot of the average mean arterial pressure (mmHg) in Baff Tg 25 mice and wildtype controls.

Figure 14 shows a plot of the individual mean arterial pressure (mmHg) for Baff Tg mice and wildtype controls.

Figure 15 shows a bar graph of the percentage of SNF1 mice that display severe nephritis after treatment with BAFF-R-Ig (BCMA-Ig), HuIgG or PBS.

Figure 16 shows a graph of the total CD11c+ DC cell number (in millions) for mice treated *in vivo* with 20 ug BCMA-Ig, 50 ug BCMA-Ig, HuIgG or PBS. CD11c+ DC cell populations examined were: (1) CD8a- CD4-, (2) CD8a+ CD4-, and (3) CD8a- CD4+.

DETAILED DESCRIPTION

5 I. Definitions

The terms “BAFF-R” and “BCMA” when used herein encompass native sequence BAFF-R and BAFF-R variants (which are further defined herein). The BAFF-R may be isolated from a variety of sources, such as from murine or human tissue types or from another source, or prepared by recombinant or synthetic methods.

10 A “native sequence BAFF-R” comprises a polypeptide having the same amino acid sequence as BAFF-R derived from nature. Such native sequence BAFF-R can be isolated from nature or can be produced by recombinant or synthetic means. The naturally-occurring truncated or secreted forms of the BAFF-R (e.g. soluble forms containing for instance, an extracellular domain sequence), naturally-occurring variant forms (e.g., alternatively spliced forms) and naturally-occurring allelic variants of the BAFF-R. In one embodiment of the invention, the native sequence BAFF-R is a mature or full-length native sequence BAFF-R polypeptide comprising amino acids 1 to 184 of SEQ ID NO: 1 or fragment thereof.

The “BAFF-R extracellular domain” or “BAFF-R ECD” refers to a form of BAFF-R which is essentially free of transmembrane and cytoplasmic domains of BAFF-R. Ordinarily, BAFF-R extracellular domain will have less than 1% of such transmembrane and cytoplasmic domains and will preferably have less than 0.5% of such domains. Optionally, BAFF-R ECD will comprise amino acid residues 8 to 41 of SEQ ID NO:1, or amino acid residues 4 to 51 of SEQ ID NO: 1, or amino acid residues 1 to 53 of SEQ ID NO: 1. In a preferred embodiment of the present invention, the BAFF-R ECD comprises amino acid residues 1 to 51 of SEQ ID NO: 1. In another preferred embodiment, the BAFF-R ECD comprises amino acid residues 1 to 50 of SEQ ID NO: 1. It will be understood by the skilled artisan that the transmembrane domain identified for the BAFF-R polypeptide of the present invention is identified pursuant to criteria routinely employed in the art for identifying that type of hydrophobic domain. The exact boundaries of a transmembrane domain may vary but most likely by no more than about 5 amino acids at

either end of the domain specifically mentioned herein. Accordingly, the BAFF-R ECD may optionally comprise amino acids 8-41 (SEQ ID NO:1).

“BAFF-R variant” means an active BAFF-R as defined below having at least about 80% amino acid sequence identity with the BAFF-R having the deduced amino acid sequence shown in SEQ ID NO:1 for a full-length native sequence BAFF-R or with a BAFF-R ECD sequence. Such BAFF-R variants include, for instance, BAFF-R polypeptides wherein one or more amino acid residues are added, or deleted, at the end or C-terminus of the sequence of SEQ ID NO:1. Ordinarily, a BAFF-R variant will have at least about 80% or 85% amino acid sequence identity, more preferably at least about 90% amino acid sequence identity, and even more preferably at least about 95% amino acid sequence identity with the amino acid sequence of SEQ ID NO:1.

“Percent (%) amino acid sequence identity” with respect BAFF-R sequences identified herein is defined as the percentage of amino acid residues in a candidate sequence that are identical with the amino acid residues in the BAFF-R sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not considering any conservative substitutions as part of the sequence identity. Alignment for purposes of determining percent amino acid sequence identity can be achieved in various ways that are within the skill in the art, for instance, using publically available computer software such as BLAST, ALIGN, or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate parameters for measuring alignment, including any algorithms needed to achieve maximum alignment over the full length of the sequences being compared.

The term “epitope tagged” when used herein refers to a chimeric polypeptide comprising BAFF-R, or a domain sequence thereof, fused to a “tag polypeptide”. The tag polypeptide has enough residues to provide an epitope against which an antibody can be made, or which can be identified by some other agent, yet is short enough so that it does not interfere with activity of the BAFF-R. The tag polypeptide preferably also is fairly unique so that the antibody does not substantially cross - react with other epitopes. Suitable tag polypeptides generally have at least 6 amino acid residues and usually between about 8 to about 50 amino acid residues (preferably, about 10 to about 20 residues).

“Isolated” when used to describe the various polypeptides disclosed herein, means polypeptide that has been identified and separated and/or recovered from a component of its natural environment. Contaminant components of its natural environment are materials that would typically interfere with diagnostic or therapeutic uses for the polypeptide, and 5 may include enzymes, hormones, and other proteinaceous or non- proteinaceous solutes. In preferred embodiments, the polypeptide will be purified (1) to a degree sufficient to obtain at least 15 residues of N-terminal or internal amino acid sequence by use of a spinning cup sequenator, or (2) to homogeneity SDS-PAGE under non-reducing or reducing conditions using Coomassie blue or preferably, silver stain. Isolated polypeptide 10 includes polypeptide *in situ* within recombinant cells, since at least one component of the BAFF-R’s natural environment will not be present. Ordinarily, however, isolated polypeptide will be prepared by at least one purification step.

The term “antibody” is used in the broadest sense and specifically covers single BAFF-R monoclonal antibodies (including agonist, antagonist, and neutralizing 15 antibodies) and anti- BAFF-R antibody compositions with polyepitopic specificity. The term “monoclonal antibody” as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e. the individual antibodies comprising the population are identical except for possible naturally-occurring mutations that may be present in minor amounts.

20 A “purified preparation” or a “substantially pure preparation” of a polypeptide, as used herein, means a polypeptide that has been separated from other proteins, lipids, and nucleic acids with which it naturally occurs. Preferably, the polypeptide is also separated from other substances, e.g., antibodies, matrices, etc., which are used to purify it.

25 The terms, “treating”, “treatment” and “therapy” as used herein refers to curative therapy, prophylactic therapy, and preventative therapy.

The terms “peptides”, “proteins”, and “polypeptides” are used interchangeably herein.

“Biologically active” as used herein, means having an *in vivo* or *in vitro* activity which may be performed directly or indirectly. Biologically active fragments of BAFF-R 30 may have, for example, 70% amino acid homology with the active site of the receptor, more preferably at least 80%, and most preferably, at least 90% homology. Identity or

homology with respect to the receptor is defined herein as the percentage of amino acid residues in the candidate sequence which are identical to the BAFF-R residues in SEQ ID NO: 1, or which are identical to a defined portion of the amino acid residues in SEQ ID NO:1.

5 The term "mammal" as used herein refers to any animal classified as a mammal including humans, cows, horses, dogs, mice and cats. In preferred embodiment of the invention, the mammal is a human.

10 The practice of the present invention will employ, unless otherwise indicated, conventional techniques of cell biology, cell culture, molecular biology, transgenic biology, microbiology, recombinant DNA, and immunology, which are within the skill of the art. Such techniques are described in the literature.

15 Reference will now be made in detail to the present preferred embodiments of the invention. This invention relates to the use of BAFF-R and BAFF-R related molecules to effect the growth and maturation of B-cells and the secretion of immunoglobulin. The invention relates to the use of BAFF-R and BAFF-R related molecules to effect responses of the immune system, as necessitated by immune-related disorders. Additionally, this invention encompasses the treatment of cancer and immune disorders through the use of a BAFF-R, or BAFF-R related gene through gene therapy methods.

20 The BAFF-R and homologs thereof produced by hosts transformed with the sequences of the invention, as well as native BAFF-R purified by the processes known in the art, or produced from known amino acid sequences, are useful in a variety of methods for anticancer, antitumor and immunoregulatory applications. They are also useful in therapy and methods directed to other diseases.

25 Another aspect of the invention relates to the use of the polypeptide encoded by the isolated nucleic acid encoding the BAFF-R in "antisense" therapy. As used herein, "antisense" therapy refers to administration or *in situ* generation of oligonucleotides or their derivatives which specifically hybridize under cellular conditions with the cellular mRNA and/or DNA encoding the ligand of interest, so as to inhibit expression of the encoded protein, i.e. by inhibiting transcription and/or translation. The binding may be by 30 conventional base pair complementarity, or, for example, in the case of binding to DNA duplexes, through specific interactions in the major groove of the double helix. In general,

“antisense” therapy refers to a range of techniques generally employed in the art, and includes any therapy which relies on specific binding to oligonucleotide sequences.

An antisense construct of the present invention can be delivered, for example, as an expression plasmid, which, when transcribed in the cell, produces RNA which is

5 complementary to at least a portion of the cellular mRNA which encodes BAFF-ligand.

Alternatively, the antisense construct can be an oligonucleotide probe which is generated ex vivo. Such oligonucleotide probes are preferably modified oligonucleotides which are resistant to endogenous nucleases, and are therefore stable in vivo. Exemplary nucleic acids molecules for use as antisense oligonucleotides are phosphoramidates, phosphothioate and

10 methylphosphonate analogs of DNA (See, e.g., 5,176,996; 5,264,564; and 5,256,775).

Additionally, general approaches to constructing oligomers useful in antisense therapy have been reviewed, for example, by Van Der Krol et al., (1988) *Biotechniques* 6:958-976; and Stein et al. (1988) *Cancer Res* 48: 2659-2668, specifically incorporated herein by reference.

15 The BAFF-R of the invention, as discussed above, is a member of the TNF receptor family. The protein, fragments or homologs thereof may have wide therapeutic and diagnostic applications.

The polypeptides of the invention specifically interact with BAFF, a polypeptide previously described in WO99/12964 incorporated by reference herein. However, the 20 peptides and methods disclosed herein enable the identification of molecules which specifically interact with the BAFF-R or fragments thereof.

The claimed invention in certain embodiments includes methods of using peptides derived from BAFF-R which have the ability to bind to BAFF. Fragments of the BAFF-Rs can be produced in several ways, e.g., recombinantly, by PCR, proteolytic digestion or by 25 chemical synthesis. Internal or terminal fragments of a polypeptide can be generated by removing one or more nucleotides from one end or both ends of a nucleic acid which encodes the polypeptide. Expression of the mutagenized DNA produces polypeptide fragments.

Chimeric molecules for use in the present invention can also be produced using 30 techniques known in the art. The present invention contemplates the use of chimeric molecules comprising a BAFF-R polypeptide (or variant thereof) fused to a heterologous

SEARCHED
SERIALIZED
INDEXED
FILED

amino acid sequence, such as the IgG Fc domain of an immunoglobulin. Preferably, such chimeric molecules are soluble and comprise a soluble BAFF-R polypeptide. In a preferred embodiment, the chimeric molecule comprises amino acid residues 1 to 50 of SEQ ID NO: 1 fused to an Fc domain. In another preferred embodiment, the chimeric molecule 5 comprises amino acid residues 1 to 51 of SEQ ID NO: 1 fused to an Fc domain. The BCMA/BAFF-R polypeptides can be fused to the Fc domain using known chemical linkers, such as G4S linkers, to modulate affinity, flexibility and functionality of the chimeric molecule.

Polypeptide fragments can also be chemically synthesized using techniques known 10 in the art such as conventional Merrifield solid phase f- moc or t-boc chemistry. For example, peptides and DNA sequences of the present invention may be arbitrarily divided into fragments of desired length with no overlap of the fragment, or divided into overlapping fragments of a desired length. Methods such as these are described in more detail below.

15 Generation of Soluble Forms of BAFF-R

Soluble forms of the BAFF-R can often signal effectively and hence can be administered as a drug which now mimics the natural membrane form. It is possible that the BAFF-R claimed herein are naturally secreted as soluble cytokines, however, if not, one can reengineer the gene to force secretion. To create a soluble secreted form of BAFF- 20 R, one would remove at the DNA level the N-terminus transmembrane regions, and some portion of the stalk region, and replace them with a type I leader or alternatively a type II leader sequence that will allow efficient proteolytic cleavage in the chosen expression system. A skilled artisan could vary the amount of the stalk region retained in the secretion expression construct to optimize both ligand binding properties and secretion 25 efficiency. For example, the constructs containing all possible stalk lengths, i.e. N-terminal truncations, could be prepared such that proteins starting at amino acids 1 to 51 would result. The optimal length stalk sequence would result from this type of analysis.

In preferred embodiments of the present invention, the soluble BAFF-R polypeptide is: an isolated native sequence BAFF-R polypeptide comprising amino acid 30 residues 1 to 51 of SEQ ID NO:1 or a fragment thereof; an isolated native sequence BAFF-R polypeptide comprising amino acid residues 1 to 50 of SEQ ID NO: 1 or a fragment

thereof; an isolated BAFF-R polypeptide having at least 80% (and more preferably 90%) amino acid sequence identity with native sequence BAFF-R polypeptide comprising amino acid residues 1 to 51 of SEQ ID NO: 1 or a fragment thereof; or an isolated BAFF-R polypeptide comprising amino acid residues 8 to 41 of SEQ ID NO: 1 or a fragment thereof.

Generation of Antibodies Reactive with the BAFF-R

The invention also includes antibodies specifically reactive with the claimed BAFF-R or its co-receptors. Anti-protein/anti-peptide antisera or monoclonal antibodies can be made by standard protocols (See, for example, *Antibodies: A Laboratory Manual* ed. by Harlow and Lane (Cold Spring Harbor Press: 1988)). A mammal such as a mouse, a hamster or rabbit can be immunized with an immunogenic form of the peptide.

Techniques for conferring immunogenicity on a protein or peptide include conjugation to carriers, or other techniques, well known in the art.

An immunogenic portion of BAFF-R or its co-receptors can be administered in the presence of an adjuvant. The progress of immunization can be monitored by detection of antibody titers in plasma or serum. Standard ELISA or other immunoassays can be used with the immunogen as antigen to assess the levels of antibodies.

In a preferred embodiment, the subject antibodies are immunospecific for antigenic determinants of BAFF-R or its co-receptors, e.g. antigenic determinants of a polypeptide of SEQ ID NO:1, or a closely related human or non-human mammalian homolog (e.g. 70, 80 or 90 percent homologous, more preferably at least 95 percent homologous). In yet a further preferred embodiment of the present invention, the anti-BAFF-R or anti-BAFF-co-receptor antibodies do not substantially cross react (i.e. react specifically) with a protein which is e.g., less than 80 percent homologous to SEQ ID NO:1; preferably less than 90 percent homologous with SEQ ID NO: 1; and, most preferably less than 95 percent homologous with SEQ ID NO:1. By "not substantially cross react", it is meant that the antibody has a binding affinity for a non-homologous protein which is less than 10 percent, more preferably less than 5 percent, and even more preferably less than 1 percent, of the binding affinity for a protein of SEQ ID NO: 1.

The term antibody as used herein is intended to include fragments thereof which are also specifically reactive with BAFF-R, or its receptors. Antibodies can be fragmented

using conventional techniques and the fragments screened for utility in the same manner as described above for whole antibodies. For example, F(ab')₂ fragments can be generated by treating antibody with pepsin. The resulting F(ab')₂ fragment can be treated to reduce disulfide bridges to produce Fab' fragments. The antibodies of the present invention are 5 further intended to include biospecific and chimeric molecules having anti-BAFF-R or anti-BAFF-co -receptor activity. Thus, both monoclonal and polyclonal antibodies (Ab) directed against BAFF-R, and their co-receptors, and antibody fragments such as Fab' and F(ab')₂, can be used to block the action of the BAFF-R and its respective co-receptors.

Various forms of antibodies can also be made using standard recombinant DNA 10 techniques. (Winter and Milstein, *Nature* 349: 293-299 (1991) specifically incorporated by reference herein.) For example, chimeric antibodies can be constructed in which the antigen binding domain from an animal antibody is linked to a human constant domain (e.g. Cabilly et al., U.S. 4,816,567, incorporated herein by reference). Chimeric antibodies 15 may reduce the observed immunogenic responses elicited by animal antibodies when used in human clinical treatments.

In addition, recombinant "humanized antibodies" which recognize BAFF-R or its co-receptors can be synthesized. Humanized antibodies are chimeras comprising mostly human IgG sequences into which the regions responsible for specific antigen-binding have 20 been inserted. Animals are immunized with the desired antigen, the corresponding antibodies are isolated, and the portion of the variable region sequences responsible for specific antigen binding are removed. The animal-derived antigen binding regions are then cloned into the appropriate position of human antibody genes in which the antigen binding regions have been deleted. Humanized antibodies minimize the use of heterologous (i.e. 25 inter species) sequences in human antibodies, and thus are less likely to elicit immune responses in the treated subject.

Construction of different classes of recombinant antibodies can also be 30 accomplished by making chimeric or humanized antibodies comprising variable domains and human constant domains (CH1, CH2, CH3) isolated from different classes of immunoglobulins. For example, antibodies with increased antigen binding site valencies can be recombinantly produced by cloning the antigen binding site into vectors carrying

the human : chain constant regions. (Arulanandam et al., J. Exp. Med., 177: 1439-1450 (1993), incorporated herein by reference.)

In addition, standard recombinant DNA techniques can be used to alter the binding affinities of recombinant antibodies with their antigens by altering amino acid residues in the vicinity of the antigen binding sites. The antigen binding affinity of a humanized antibody can be increased by mutagenesis based on molecular modeling. (Queen et al., Proc. Natl. Acad. Sci. 86: 10029-33 (1989) incorporated herein by reference.

Generation of Analogs: Production of Altered DNA and Peptide Sequences

Analogs of the BAFF-R can differ from the naturally occurring BAFF-R in amino acid sequence, or in ways that do not involve sequence, or both. Non-sequence modifications include in vivo or in vitro chemical derivatization of the BAFF-R. Non-sequence modifications include, but are not limited to, changes in acetylation, methylation, phosphorylation, carboxylation or glycosylation.

Preferred analogs include BAFF-R biologically active fragments thereof, whose sequences differ from the sequence given in SEQ ID NO: 1, by one or more conservative amino acid substitutions, or by one or more non-conservative amino acid substitutions, deletions or insertions which do not abolish the activity of BAFF-ligand. Conservative substitutions typically include the substitution of one amino acid for another with similar characteristics, e.g. substitutions within the following groups: valine, glycine; glycine, alanine; valine, isoleucine, leucine; aspartic acid, glutamic acid; asparagine, glutamine; serine, threonine; lysine, arginine; and, phenylalanine, tyrosine.

Uses

The full length BAFF-R gene (SEQ ID NO: 2) or portions thereof may be used as hybridization probes for a cDNA library to isolate, for instance, still other genes which have a desired sequence identity to the BAFF-R sequence disclosed in SEQ ID NO: 2. Nucleotide sequences encoding BAFF-R can also be used to construct hybridization probes for mapping the gene which encodes the BAFF-R and for the genetic analysis of individuals with genetic disorders. Screening assays can be designed to find lead compounds that mimic the biological activity of a BAFF-R. Such screening assays will

include assays amenable to high-throughput screening of chemical libraries, making them particularly suitable for identifying small molecule drug candidates. Small molecules contemplated include synthetic organic or inorganic compounds. Nucleic acids which encode BAFF-R or its modified forms can also be used to generate either transgenic 5 animals or "knock out" animals which in turn are useful in the development and screening of therapeutically useful reagents.

As described herein, in one embodiment of the invention, there are provided methods of stimulating B-cell growth, dendritic cell-induced B-cell growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide or co-stimulating 10 B-cell growth, dendritic cell-induced B-cell growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide and an anti-T antibody, a CD40 ligand or an anti-CD40 ligand. Also included are methods of inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation or immunoglobulin production in an animal using BAFF-R polypeptide.

15 In another embodiment, the invention provides methods of using BAFF-R in the treatment of autoimmune diseases, hypertension, cardiovascular disorders, renal disorders, B-cell lympho-proliferate disorders, immunosuppressive diseases, organ transplantation, inflammation, and HIV. Also included are methods of using agents for treating, suppressing or altering an immune response involving a signaling pathway between BAFF- 20 R and its ligand.

In one embodiment, the invention provides pharmaceutical compositions comprising a BAFF-R polypeptide and a pharmaceutically acceptable excipient. Suitable carriers for a BAFF-R polypeptide, for instance, and their formulations, are described in Remington' Pharmaceutical Sciences, 16th ed., 1980, Mack Publishing Co., edited by Oslo 25 et al. Typically an appropriate amount of a pharmaceutically acceptable salt is used in the formulation to render the formulation isotonic. Examples of the carrier include buffers such as saline, Ringer's solution and dextrose solution. The pH of the solution is preferably from about 5 to about 8, and more preferably from about 7.4 to about 7.8. Further carriers include sustained release preparations such as semipermeable matrices of 30 solid hydrophobic polymers, which matrices are in the form of shaped articles, e.g. liposomes, films or microparticles. It will be apparent to those of skill in the art that

2025 2020 2015 2010 2005 2000 1995 1990 1985 1980 1975 1970 1965 1960 1955 1950 1945 1940 1935 1930 1925 1920 1915 1910 1905 1900 1895 1890 1885 1880 1875 1870 1865 1860 1855 1850 1845 1840 1835 1830 1825 1820 1815 1810 1805 1800 1795 1790 1785 1780 1775 1770 1765 1760 1755 1750 1745 1740 1735 1730 1725 1720 1715 1710 1705 1700 1695 1690 1685 1680 1675 1670 1665 1660 1655 1650 1645 1640 1635 1630 1625 1620 1615 1610 1605 1600 1595 1590 1585 1580 1575 1570 1565 1560 1555 1550 1545 1540 1535 1530 1525 1520 1515 1510 1505 1500 1495 1490 1485 1480 1475 1470 1465 1460 1455 1450 1445 1440 1435 1430 1425 1420 1415 1410 1405 1400 1395 1390 1385 1380 1375 1370 1365 1360 1355 1350 1345 1340 1335 1330 1325 1320 1315 1310 1305 1300 1295 1290 1285 1280 1275 1270 1265 1260 1255 1250 1245 1240 1235 1230 1225 1220 1215 1210 1205 1200 1195 1190 1185 1180 1175 1170 1165 1160 1155 1150 1145 1140 1135 1130 1125 1120 1115 1110 1105 1100 1095 1090 1085 1080 1075 1070 1065 1060 1055 1050 1045 1040 1035 1030 1025 1020 1015 1010 1005 1000 995 990 985 980 975 970 965 960 955 950 945 940 935 930 925 920 915 910 905 900 895 890 885 880 875 870 865 860 855 850 845 840 835 830 825 820 815 810 805 800 795 790 785 780 775 770 765 760 755 750 745 740 735 730 725 720 715 710 705 700 695 690 685 680 675 670 665 660 655 650 645 640 635 630 625 620 615 610 605 600 595 590 585 580 575 570 565 560 555 550 545 540 535 530 525 520 515 510 505 500 495 490 485 480 475 470 465 460 455 450 445 440 435 430 425 420 415 410 405 400 395 390 385 380 375 370 365 360 355 350 345 340 335 330 325 320 315 310 305 300 295 290 285 280 275 270 265 260 255 250 245 240 235 230 225 220 215 210 205 200 195 190 185 180 175 170 165 160 155 150 145 140 135 130 125 120 115 110 105 100 95 90 85 80 75 70 65 60 55 50 45 40 35 30 25 20 15 10 5 0

certain carriers may be more preferable depending upon for instance the route of administration and concentration of the a BAFF-R polypeptide being administered.

Administration may be accomplished by injection (eg intravenous, intraperitoneal, subcutaneous, intramuscular) or by other methods such as infusion that ensure delivery to the bloodstream in an effective form.

Practice of the present invention will employ, unless indicated otherwise, conventional techniques of cell biology, cell culture, molecular biology, microbiology, recombinant DNA, protein chemistry, and immunology, which are within the skill of the art. Such techniques are described in the literature. See, for example, **Molecular Cloning**:

The following Examples are provided to illustrate the present invention, and should not be construed as limiting thereof.

25

EXAMPLES:

Example 1: Detection of BAFF binding to BAFF-R using a Plate Assay

In this example, the binding of BAFF to BAFF-R transfected cells using a plate assay is described.

Full-length human BAFF-R was generated from BJAB polyA+ RNA using the SuperscriptII preamplification kit (Life Technologies) to generate the cDNA template and amplified by Pfu1 using primers complementary to the 5' and 3' coding sequences of BAFF-R. The PCR product was cloned into CH269, a derivative of pCEP4 (Invitrogen).

5 The resultant clone was termed pJST535. Human embryonic kidney cells containing the EBNA-1 gene (293EBNA) were seeded into 6 well plates coated with fibronectin and transfected by lipofectamine (Life Technologies) with either pJST535 at various dilutions or CH269 as a background control. At 48 hrs post transfection, transfected cells were assayed for their ability to bind soluble flag-hBAFF(amino acids L83-L285) as follows.

10 All incubations were at room temperature. Conditioned media was aspirated from the wells and the cells washed with BHA buffer (20mM HEPES pH7.0, 0.5mg/ml BSA, 0.1% NaN3) and incubated with 0.5ug/ml FLAG-hBAFF diluted in PBS containing 1mM MgCl2, 1mM CaCl2 and 0.1% NaN3. After an 1 hr. incubation, the BAFF solution was removed and the cells were washed with BHA. The cells were next incubated for 30min.

15 in a PBS solution containing 1ug/ml of the anti-FLAG monoclonal antibody, M2 (Sigma). This solution was aspirated and the cells were washed with BHA. The cells were then incubated for 30 min. in a 1:3000 dilution of the alkaline phosphatase conjugated goat anti-mouse IgG F(ab)'2 (Jackson ImmunoResearch). This solution was aspirated and the cells washed with BHA. To reduce the amount of background staining due to endogenous

20 alkaline phosphatase, the cells were incubated for 15 min. in 2.5mM levamisol (Vector Laboratories) diluted in 100mM NaCl, 100mM Tris-Cl pH9.5 and 5mM MgCl2. For chromogenic detection of alkaline phosphatase, the inhibitor solution was aspirated and the cells were incubated with a solution of fast red and naphthol phosphate (Pierce). Staining was observed and photographed through a low power microscope.

25 The deposition of fast red dye was observed for all the wells transfected with the BAFF-R expressing plasmid, pJST535. The frequency of the signal titrated away as the amount of plasmid transfected into the cells decreased. No staining was observed for the control expression vector, CH269, transfected cells. Also, no staining was observed on any of the transfected cells when FLAG-hBAFF was omitted from the staining staining

30 protocol or when another TNF family member ligand, FLAG-tagged LIGHT, was

substituted for flag-hBAFF. Therefore the staining of BAFF-R transfected cells with BAFF appears specific.

Example 2: BAFF Binding to BAFF-R transfected cells by FACS analysis

5 This example describes the detection of BAFF to BAFF-R transfected cells using FACS analysis.

The plasmid encoding full-length BAFF-R, pJST535, was transfected into 293EBNA cells using FuGene6 (Boehringer Mannheim). At 24 or 48hr post transfection, cells were removed from the plates using 5mM EDTA in PBS and counted. The cells were 10 washed twice with FACS buffer (PBS containing 10% fetal bovine serum, 0.1% NaN3 and 10 ug/ml hIgG (Jackson ImmunoResearch) and then 2.5×10^5 cells were incubated for 1hr on ice with FLAG-hBAFF diluted into FACS buffer at concentrations ranging from 9 ug/ml to 0.037 ug/ml. The cells were washed with FACS buffer and incubated with the anti-FLAG monoclonal antibody, M2, at 5 ug/ml for 30 min. on ice. The cells were 15 washed with FACS buffer and incubated for 30 min. on ice in a solution containing a 1:100 dilution of R-phycerythrin conjugated F(ab')2 donkey anti-mouse IgG and 10ug/ml 7-AAD. After the cells were washed with FACS buffer, they were resuspended in FACS buffer containing 1% paraformaldehyde. FACS analysis followed where the 7-AAD positive (dead) cells were gated out.

20 The results of the FACS analysis indicate that a fraction of the cells that were transfected with BAFF-R are able to bind BAFF. At a BAFF concentration of 9 ug/ml, about 28% of the cells bind BAFF for a mean fluorescence intensity (MFI) of 366. Using the PE-labeled donkey anti-mouse reagent alone, there is not a significant shift of the cells. Only 1.3% of the cells have a MFI of 23.5 with the average of all the cells being 5.5. The 25 signal on the BAFF-R transfected cells titrates out with decreasing amounts of BAFF. At 100 ng/ml, 8.76% of the cells have an MFI of 78.9.

Example 3: FACS analysis of BAFF/BAFF-R interaction including a GFP marker

In this example, the ability of BAFF to bind to cells co-transfected with BAFF-R 30 and a GFP reporter plasmid is described.

The 293EBNA cells were transfected with pJST535 and a GFP reporter plasmid, as described in example 2. The reporter plasmid encodes a membrane anchored GFP molecule. Using co-transfection of the two plasmids, we analyzed the percentage of transfected cells which were capable of binding BAFF. The cells were removed from the 5 plates and subjected to BAFF binding and detection as described in example 2. Again, 7-AAD was included in order to gate out the dead cells. The samples were analyzed by FACS and plotted. The upper right quadrant represents cells with bound BAFF (phycoerythrin positive) and expressing GFP.

Although not all of the GFP transfected cells appear to bind BAFF, there is a 10 significant fraction of the cells in the upper right quadrant compared to the control. Thirty-three percent of the transfected cells are in the upper right compared to 8 percent. It may be that a certain level of BAFF-R expression is required for BAFF to bind to the cells. It is also possible that a co-receptor is required for a high affinity interaction and that this receptor is limiting on the 293EBNA cells.

15

Example 4: Immunoprecipitation of flag-hBAFF by BAFF-R-Fc Fusion

This example describes specific interaction of flag-hBAFF with BAFF-R-Fc, a molecule composed of the Cysteine Rich Domain (CRD) of BAFF-R fused to the Fc domain of human IgG1.

20

The CRD of BAFF-R was generated by RT-PCR from BJAB polyA+ RNA as in Example 1 using as a 3' primer an oligo complementary to nucleotides 132-152 of the hBAFF-R coding sequence. The resultant PCR fragment was cloned in CH269 downstream of a murine IgG-kappa signal sequence and upstream of the Fc moiety of human IgG. This construct was termed pJST538. The construct pJST538 or CH269 were 25 transfected to 293EBNA by lipofectamine. Conditioned media and cell extracts were harvested at 20 hours post transfection. Cells were solubilized in 20mM Tris pH7.5/50mM NaCl/ 0.5% NP40/ 0.5% deoxycholic acid and debris spun out. An aliquot of the conditioned media and cell extracts were combined with an equal volume 2x SDS reducing buffer, boiled and subjected to SDS-PAGE and Western transfer. To verify expression, the 30 membrane was probed with 1:3000 dilution of mouse anti-human IgG conjugated to horse radish peroxidase (HRP) in 5% nonfat dry milk in TBST at room temperature for 30

minutes and washed with TBST. Blots were developed with ECL (Amersham) and exposed to film.

Immunoprecipitations were performed by incubating 25ng of either flag-hBAFF or flag-hTWEAK with 0.5 ml of conditioned media from 293EBNA transfected with either 5 pJST538 or CH269 at 4°C for 1 hour with agitation followed by the addition of 30ul ProteinA-Sepharose (Pharmacia) and continued agitation overnight. ProteinA-Sepharose beads were washed twice with PBS and resuspended in 2xSDS reducing sample buffer. After SDS-PAGE and western transfer, the blots were incubated with 5ug/ml anti-flag monoclonal antibody M2 (Sigma) in 5% nonfat dry milk in TBST at room temperature for 10 1 hour. Blots washed with TBST and incubated with a 1:3000 dilution of goat anti-mouse IgG HRP conjugate (Jackson Immunoresearch) in 5% nonfat dry milk in TBST at room temperature for 30 minutes. Blots were developed with ECL (Amersham) and exposed to film.

Upon transfection of pJST538 to 293EBNA cells, expression of an approximately 15 43kDa protein was detected in both the cell extract and conditioned medium by Western blot analysis with mouse anti-human IgG (Jackson Immunoresearch), indicating that the BAFF-R-Fc fusion was efficiently expressed and secreted.

In the immunoprecipitations a band was observed only as a result of the incubation of BAFF-R-Fc and flag-hBAFF. This band co-migrated with a directly loaded sample of 20 flag-hBAFF. None of the other lanes produced a signal, indicating that the interaction between BAFF-R-Fc and flag-hBAFF is specific.

Example 5: Generation of Soluble Receptor Forms:

To form an receptor inhibitor for use in man, one requires the human receptor 25 cDNA sequence of the extracellular domain. If the mouse form is known, human cDNA libraries are screened using the mouse cDNA sequence and such manipulations are routinely carried out in this area. With a human cDNA sequence, one can design oligonucleotide primers to PCR amplify the extracellular domain of the receptor in the absence of the transmembrane and intracellular domains. Typically, one includes most of 30 the amino acids between the last disulfide linked "TNF domain" and the transmembrane

domain. One can vary the amount of "stalk" region included to optimize the potency of the resultant soluble receptor. This amplified piece would be engineered to include suitable restriction sites to allow cloning into various C-terminal Ig fusion chimera vectors.

Alternatively, one can insert a stop signal at the 3' end and make a soluble form of the

5 receptor without resorting to the use of a Ig fusion chimera approach. The resultant vectors can be expressed in most systems used in biotechnology including yeast, insect cells, bacteria and mammalian cells and examples exist for all types of expression. Various human Fc domains can be attached to optimize or eliminate FcR and complement interactions as desired. Alternatively, mutated forms of these Fc domains can be used to 10 selectively remove FcR or complement interactions or the attachment of N-linked sugars to the Fc domain which has certain advantages.

Example 6: Generation of Agonistic or Antagonistic Antibodies:

15 The above described soluble receptor forms can be used to immunize mice and to make monoclonal antibodies by conventional methods. The resultant mAbs that are identified by ELISA methods can be further screened for agonist activity either as soluble antibodies or immobilized on plastic in various in vitro cellular assays. Often the death of the HT29 cell line is a convenient system that is sensitive to signaling through many TNF

20 receptors. If this line does not possess the receptor of interest, that full length receptor can be stably transfected into the HT29 line to now allow the cytotoxicity assay to work. Alternatively, such cells can be used in the Cytosensor apparatus to assess whether activation of the receptor can elicit a pH change that is indicative of a signaling event.

TNF family receptors signal well in such a format and this method does not require one to

25 know the actual biological events triggered by the receptor. The agonistic mAbs would be "humanized" for clinical use. This procedure can also be used to define antagonistic mAbs. Such mAbs would be defined by the lack of agonist activity and the ability to inhibit receptor-ligand interactions as monitored by ELISA, classical binding or BIACore techniques. Lastly, the induction of chemokine secretion by various cells in response to an

30 agonist antibody can form a screening assay.

Example 7: Screening for Inhibitors of the Receptor-Ligand Interaction:

Using the receptor-Ig fusion protein, one can screen either combinatorial libraries for molecules that can bind the receptor directly. These molecules can then be tested in an
5 ELISA formatted assay using the receptor-Ig fusion protein and a soluble form of the ligand for the ability to inhibit the receptor-ligand interaction. This ELISA can be used directly to screen various natural product libraries etc. for inhibitory compounds. The receptor can be transfected into a cell line such as the HT29 line to form a biological assay (in this case cytotoxicity) that can then form the screening assay.

10

Example 8: BAFF-R-IgG Causes a reduction in the number of B cells in Normal Mice

Eight-week-old female BALB/c mice were purchased from The Jackson Laboratory (Bar Harbor, ME). Mice (3/group) received i.p. either PBS, 400 µg of human
15 BAFF-R-huIgG1 (hBAFF-R-Ig) fusion protein (supplied by Teresa Cachero, Biogen), or 400 µg of purified human IgG (HuIgG) (Sandoz, Basel, Switzerland) on days -8, -5, -1 and +2. Mice received 100 µl of 10% sheep red blood cells (SRBC) (Colorado Serum Company, Denver, CO) on day 0.

At the time of sacrifice, blood was collected via cardiac puncture into tubes
20 containing EDT, and red blood cells were lysed in a hypotonic buffer. Blood was also collected without EDTA for serum preparation. Single cell suspensions were prepared from spleens and mesenteric lymph nodes (MLN) and red blood cells were lysed in a hypotonic buffer. Flow cytometry was performed using PE-conjugated anti-CD45R/B220, anti-syndecan/CD138 and anti-B7.2, and FITC-conjugated anti-IgM and anti-
25 CD45R/B220. All mAbs were purchased from Pharmingen (San Diego, CA). Briefly, Fc receptors were blocked with 10 µg/ml Fc Block (Pharmingen) for 15 min. on ice, followed by addition of PE- and FITC-conjugated mAbs and incubated on ice for 20-30 min. Cells were washed 1x and suspended in 0.5% paraformaldehyde. Cell fluorescence data were acquired on a FACSCalibur™ flow cytometer (Becton Dickinson, San Jose, CA) and
30 analyzed using CELLQuest™ software (Becton Dickinson).

After treatment with hBAFF-R-Ig there was approximately a 50% reduction in the number of B cells in peripheral blood and in the peripheral lymphoid organs examined.

B220^{high} IgM^{low} B cells accounted for 23.4% and 21.5% of cells in PBS-treated and HuIgG-treated mice, respectively, whereas this population represented only 9.9% of cells

5 in hBAFF-R-Ig-treated mice. Plasma cells (syndecan/CD138+) appeared to be slightly decreased as well with 5.7% and 4.8% present in the blood of PBS-treated and HuIgG-treated mice, respectively, compared with 3.9% in hBAFF-R-Ig-treated mice. The B7.2 molecule was upregulated on 3.1% and 4.5% of B220+ cells in PBS-treated and HuIgG-treated mice, respectively, compared with 1.9% in hBAFF-R-Ig-treated mice.

10 In the spleen B220^{high} B cells were markedly reduced in hBAFF-R-Ig-treated mice representing 18.8%, compared with 36.7% and 40% in PBS- and HuIgG-treated mice, respectively. This decline was observed in both IgM^{high} and IgM^{low} subpopulations (see Table 8A). There was no change observed in the newly formed B cell compartment in the spleen, B220^{low} IgM^{high} (data not shown). Plasma cells (syndecan/CD138+) appeared to be 15 slightly decreased as well with 3.3% and 3.4% present in the spleen of PBS-treated and HuIgG-treated mice, respectively, compared with 2.4% in hBAFF-R-Ig-treated mice.

The MLN exhibited a decline in B220+ B cells with 14.1% present in hBAFF-R-Ig-treated mice compared with 26.7% and 35.8% in PBS-treated and HuIgG-treated mice, respectively. The data are summarized in Table 8A.

Table 8A. B cell populations in hBAFF-R-Ig, PBS and HuIgG-treated mice¹.

<u>Blood</u>	<u>B220^{high}</u> <u>IgM^{low}</u>	<u>Syndecan</u>	<u>B7.2/B220^{low}</u>

¹ The mice were treated as described in the Materials and Methods section, and the data are given as percent ± standard

Deviation

The decreased percentage of B7.2+ B cells in the blood and plasma cells in the blood and spleens of hBAFF-R-Ig-treated mice after immunization with SRBCs suggests
5 that there is inhibition of B cell activation and/or maturation, and potentially increased elimination of activated B cells. A very minor percent of antigen-specific B cells would be activated and respond to any antigen, in this case SRBC. Because the hBAFF-R-Ig treatment resulted in such a dramatic reduction in the percent of B cells in all tissues examined, ~50%, the activity of hBAFF-R-Ig appears to also target resting, mature B cells.

10

It is therefore contemplated that BAFF-R fusion protein may be used as a therapeutic drug with clinical application in B cell-mediated diseases. Diseases include those that are autoimmune in nature such as systemic lupus erythematosus, myasthenia gravis, autoimmune hemolytic anemia, idiopathic thrombocytopenia purpura, anti-
15 phospholipid syndrome, Chaga's disease, Grave's disease, Wegener's Granulomatosis, Poly-arteritis Nodosa and Rapidly Progressive Glomerulonephritis. The therapeutic agent also has application in plasma cell disorders such as multiple myeloma, Waldenstrom's macroglobulinemia, Heavey-chain disease, Primary or immunocyte-associated amyloidosis, and Monoclonal gammopathy of undetermined significance (MGUS).

20 Oncology targets include B cell carcinomas, leukemias, and lymphomas.

Example 9: Blocking BAFF induced B cell proliferation in vitro using soluble BAFF-R

In this example we show that the soluble BAFF-R: hIgG1 fusion protein is capable
25 of blocking BAFF induced B cell proliferation in mouse splenocytes.

Murine splenocytes (5×10^5 cells/ml) from Balb/c mice were isolated and cultured in a 96-well plate in 100 μ l of RPMI (Life Technologies) supplemented with 10% fetal calf serum (JRH), 2 mM glutamine, 100 units/ml penicillin and 100 mg/ml streptomycin (Life Technologies). Then various amounts of human BAFF, 10 μ g/ml human BAFF-R: hIgG1
30 or human Ig, as well as 10 μ g/ml of anti-mouse surface μ heavy chain (Jackson Immuno Research) were added. After 48 h in culture at 37°C, cells were pulsed for 24 h with 1

μ Ci/well [*methyl-³H*] thymidine (Dupont NEN) and harvested using a Tomtec (Orange, CT) cell harvester. The radioactivity was measured in a Betaplate liquid scintillation counter (Pharmacia Biotech).

Figure 8 shows the results of the splenocyte Proliferation Assay. Shown are the counts per minute (CPM) incorporated into the mouse splenocyte cells vs. the amount of human BAFF reagent added. The level of anti- μ or fusion protein or control hIgG is held constant at 10 μ g/ml. The solid squares represent the level of proliferation induced by BAFF alone. The solid circles represent the proliferation of the cells with BAFF and anti- μ . The curve with the open triangle represents the inhibition observed when BAFF-R: hIgG1BAFF is added with anti- μ plus BAFF-R:hIgG1. The open diamond represents the inhibition observed using control human Ig.

The addition of BAFF plus anti- μ results in the proliferation of mouse splenocytes *in vitro*. The level of ³H thymidine incorporated into the cells is significantly higher than the level obtained when either BAFF alone or anti- μ alone is added to the splenocytes. The treatment of the splenocytes with BAFF alone results in ³H-thymidine incorporation only at very high concentrations. The addition of anti- μ alone results in no proliferation. When 10 μ g/ml of control human Ig was added to the splenocytes with increasing amounts of BAFF and 10 μ g/ml anti- μ , there was a modest decrease in the level of proliferation. In contrast, when 10 μ g/ml of a human BAFF-R: hIgG1 fusion protein is added to the assay under the same conditions, the extent of proliferation is reduced to the level observed for the BAFF alone treatment. This indicates that the BAFF-R: hIgG1 fusion protein is capable of inhibiting the proliferation of splenocytes induced by BAFF and anti- μ .

Example 10: Blocking BAFF binding to Raji cells using BAFF-R: hIgG1

In this example, pre-incubation of BAFF with BAFF-R: hIgG1 fusion protein resulting in the reduction of BAFF binding to the Raji B cell lymphoma line is described.

In this FACS assay, 200 ng/ml FLAG-tagged human BAFF was pre-incubated with either human BAFF-R: hIgG1 or human LT β R: hIgG1 at two fold dilutions ranging from 20 μ g/ml to 39 ng/ml or no fusion protein for 30 min. on ice. The incubation took place in a FACS buffer containing PBS without Ca²⁺ or Mg²⁺ plus 10% FCS (JRH) and 0.05%

sodium azide. After pre-incubation, the BAFF-fusion protein mixture was added to 5×10^6 Raji (ATCC) cells/ml. This incubation took place for 30 min. on ice and then the cells were washed with 2 ml of FACS buffer at 4°C. In order to detect the bound BAFF, 5 µg/ml of anti-FLAG antibody M2 (Sigma) was added to the cells and incubated for 30 min. on ice. The cells were again washed as above and then incubated with a 1:100 dilution of PE conjugated donkey anti-mouse Ig (Jackson Immuno Research) for 30 min. on ice. After the cells were washed again with FACS buffer, they were fixed with 1% paraformaldehyde and read by FACS® (Becton Dickinson and Co.)

Figure 9 shows the results of the BAFF blocking assay. Shown are the MFI (mean fluorescence intensity) readings resulting from a FACS® analysis examining BAFF binding to Raji cells. The solid squares represent the data when human BAFF-R: hIgG1 is pre-incubated with BAFF prior to binding to the cells. The circles show the curve resulting from addition of a non-specific fusion protein, human LTβR: hIgG1, to BAFF. The x-axis represents the amount of fusion protein added to 200 ng/ml BAFF prior to incubation with the cells.

When no fusion protein is pre-incubated with human BAFF, the mean fluorescence intensity (MFI), of the sample was 80. When human LTβR: hIgG1 is pre-incubated with BAFF, even at 20 µg/ml, the detection of BAFF binding to Raji cells is unchanged. When human BAFF-R: hIgG1 is pre-incubated with BAFF, however, there is a substantial decrease in the MFI, down to 20-25 even at 625 ng/ml fusion protein. The background MFI for this experiment is 7. Thus, BAFF-R: hIgG1 is very effective at blocking BAFF binding to Raji B cells.

Example 11: BAFF-R – IgG Attenuates lupus-like autoimmune disorders in transgenic mice

This example describes the effects of BAFF-R – Ig to reduce the peripheral B-cell pool and inhibit development of splenomegally and nephritis.

Five-month-old BAFF transgenic (Tg) mice (C57BL/6) and age-matched littermates were used in the experiment. BAFF Tg mice manifest lymphocytic disorders and an autoimmune phenotype similar to systemic lupus erythematosus (Mackay et al.,

1999). This phenotype includes increased peripheral B cell populations including Transitional 1 (T1) and 2 (T2), mature (M), marginal zone (MZ) and CD1^{high}/IgM^{high} B cells.

5 The mice received i.p. PBS, 400 mg of purified human IgG (hIg) (Sandoz, Basel, Switzerland) (3/group) or 400 µg of CHO-derived human BAFF-R-huIgG1 (hBCMA-Ig) fusion protein (2/group) on days 0, 4, 7, 11, 14, 18, 21, 25, 28, 32, 35 and were sacrificed at day 40.

10 At the time of sacrifice, spleen weight was measured and single cell suspensions were prepared after lysing red blood cells in a hypotonic buffer. Flow cytometry was performed using FITC-conjugated anti-CD21/CD35, PE-conjugated anti-IgD and anti-CD1, cychrome-conjugated anti-CD45R/B220 and biotin-conjugated anti-IgM. All mAbs were purchased from Pharmingen (San Diego, CA). Briefly, Fc receptors were blocked with 10 µg/ml Fc Block (Pharmingen) for 10 min on ice, followed by addition of biotin-conjugated mAbs for 30 min on ice, cells were washed 1x, followed by addition of FITC, 15 PE, Cychrome-conjugated Abs, strep-avidin APC and 10 µg/ml Fc Block. Cells were incubated for 30 min on ice, washed 1x and suspended in 0.5% paraformaldehyde. Cell fluorescence data were acquired on a FACSCalibur (flow cytometer (Becton Dickinson, San Jose, CA) and analyzed using CELLQuest (software (Becton Dickinson).

20 The presence of proteins in mouse urine was measured using Multistix 10 SG reagent strips for urinalysis (Bayer Corp., Diagnostics Division).

Results are shown in Tables 11A and 11B below:

15	Mean	3.9+/-2	4.8+/-1.5	2.4+/-1	59+/-20

The spleens of the 3 month old Baff Tg mice (n=3) and age-matched littermates (n=2) were isolated and subjected to FACS analyses as described in the Materials and Methods. The T1, T2, M and MZ cells were defined by the expression of the following surface

20 markers (hi: high., lo: low., int:intermediate):

T1:IgD⁻, IgM^{high}, CD21^{lo}

MZ:IgD⁻, IgM^{hi}, CD21

T2:IgD⁺, IgM^{hi}, CD21^{hi}

25 M:IgD⁺, IgM^{lo}, CD21^{int}

10 month old Baff Tg mice (n=3) and age-matched littermates (n=3) were subjected to FACS analyses as described in Table 1.

After administration of h BAFF-R-Ig to Baff Tg mice the T1, T2, M, MZ populations and the CD1^{high}/IgM^{high} B cells in the spleen were reduced significantly as compared to the PBS and hIg treated Baff Tg mice, the total numbers of T1, T2, M, MZ and CD1^{high}/IgM^{high} B cells were reduced to the level similar or lower than that of the control littermates treated with PBS (Fig. 10a, 10b, 10c).

BAFF-R-Ig treatment of Baff Tg mice resulted in an attenuation of Baff-mediated autoimmune disease as evidenced by the observation that BAFF-R-treated mice had spleens of normal size while control-treated Baff Tg mice exhibited splenomegally (Fig. 11). In addition, the development of proteinuria, an indicator of renal dysfunction, was inhibited in BAFF-R-Ig treated mice, whereas control-treated Baff Tg mice developed nephritis as determined by rising proteinuria levels (Fig. 12).

Mice transgenic for Baff have vastly increased numbers of peripheral B cells, and our further analysis revealed predominantly increased T1, T2, MZ B cell subpopulations in these mice. The transitional stage of B cell development (T1 and T2) is the checkpoint at which autoreactive B cells are presumably eliminated. CD1^{hi}/IgM^{high} B cells, which tend to reside in the marginal zone, were also highly increased in Baff Tg mice. This latter population of B cells was shown to be the major source of autoantibody production in NZB/NZW lupus mice. Treatment of Baff Tg mice with BAFF-R-Ig results in a reduction of the T1, T2, MZ and CD1^{hi} B cell populations to levels similar to or lower than those found in wildtype littermate controls.

BAFF-R-Ig functioned to reduce the peripheral B cell pool and inhibit development of splenomegally and nephritis. Therefore, in addition to its usefulness in systemic lupus erythematosus lupus nephritis, the action of BAFF-R-Ig is also useful as in B cell-mediated diseases that are autoimmune in nature such as myasthenia gravis, autoimmune hemolytic anemia, idiopathic thrombocytopenia purpura, anti-phospholipid syndrome, Chaga's disease, Grave's disease, Wegener's Granulomatosis, Poly-arteritis Nodosa and Rapidly Progressive Glomerulonephritis. This therapeutic agent also has application in plasma cell disorders such as multiple myeloma, Waldenstrom's macroglobulinemia, Heavey-chain disease, Primary or immunocyte-associated amyloidosis, and Monoclonal gammopathy of undetermined significance (MGUS). Oncology targets include B cell carcinomas, leukemias, and lymphomas.

Example 12: Mean Arterial Pressure in BAFF Transgenic Mice

5 This experiment describes the measurement of blood pressure in BAFF transgenic mice. Observations made during phenotype evaluation of BAFF transgenic mice indicated the potential for hypertension in the mice.

10 Baff Tg mice as described above were anesthetized with ketamine. The left carotid artery was exposed via an incision in the neck. A catheter was inserted into the carotid artery for measurement of blood pressure and heart rate. The catheter was connected to a pressure transducer and blood pressure was measured using a Gould data acquisition system (Po-Ne-Mah Data Acquisition system and Gould polygraph). From the pulsatile pressure waveform, systolic pressure, diastolic pressure, mean pressure and heart rate were derived. Two groups of mice were used: BAFF transgenics (n=8) and Wild-Type 15 Controls (n=9).

20 Figure 13 displays the average mean arterial pressure (MAP, in mmHg) for the two groups. As shown, the BAFF transgenic mice had an average MAP of 102 ± 8 mmHg. The control mice had an average MAP of 92 ± 6 mmHg. Thus, the BAFF mice demonstrate a 10 mmHg increase in MAP over controls, although this did not achieve 25 statistical significance (ANOVA).

More detailed analysis of the data are shown in Figure 14. In this figure, the results from individual animals are displayed. In the wild-type controls (BAFF -), the distribution of the data follow a typical, binomial distribution. In contrast, the pressures in the BAFF transgenic mice (BAFF+) appear as if they distribute into two groups, with one group in 25 the 120-130 mmHg range and one group in the 80-90 mmHg range.

As a population, the BAFF transgenic mice have a tendency towards hypertension, as compared to negative control mice. Analysis of individual levels of arterial pressure indicate the BAFF transgenic mice are distributed into two sub-populations, one with high blood pressure and one with normal blood pressure. Accordingly, administering a soluble 30 BAFF-R, fusion protein or antibody homolog can ameliorate the effects of hypertension.

Example 13: BAFF-R-Ig Treatment of SNF₁ mice with established disease slows progression to severe nephritis.

Female lupus-prone (SWR x NZB)F1 (SNF₁) mice, aged 21 weeks and exhibiting moderate nephritis (30-100 mg/dl proteinuria), received 200 µg of fusion protein human

5 BAFF-R-huIgG1 (hBCMA-Ig), human IgG (HuIgG) (Sandoz), or 200 µl of PBS i.p. weekly for 8 weeks. The urine of each mouse was monitored weekly for proteinuria using Albustix (Bayer Corp., Terrytown, NY). Proteinuria over 100 mg/dl was scored as severe nephritis. BAFF-R-Ig was produced from transiently transfected EBNA 293 cells. Conditioned media from 293 cells over-expressing hBCMA-Ig was loaded onto a protein 10 A column. Protein was eluted using 25 mM phosphate 100 mM NaCl pH 2.8 following by neutralization with 1/20 volume of 0.5 M NaPO₄ pH 8.6. Selected fractions based in OD280 were subjected to reducing and non-reducing SDS-PAGE gels and Western blots to identify the purified protein.

Three weeks after treatment was terminated 50% of mice treated with BAFF-R-Ig 15 exhibited severe nephritis, compared to 75% and 87.5% of mice that received HuIgG and PBS, respectively (see Figure 15). These data demonstrate that the soluble BAFF receptor, BCMA-Ig, can function to block B cell-mediated autoimmune disease, such as lupus nephritis, resulting in a marked delay in disease progression.

20 **Example 14: BAFF-R-Ig treatment of normal mice results in a reduction in the number of splenic dendritic cells (DC) and an atypical splenic localization.**

Seven-week-old female BALB/c mice (3/group) were given i.p. either 20 µg or 50 µg human BAFF-R-IgG1 (hBCMA-Ig), 50 µg human IgG (HuIgG) or 100 µl PBS

25 1x/week for 4 weeks. The hBCMA-Ig fusion protein was purified from culture supernatants of a stably transfected CHO cell line. Spleens were obtained 8 days after the last injection and digested with collagenase (Sigma cat.#C-5138) for 1 hr. at 37°C. A single cell suspension was prepared, RBCs were lysed in a hypotonic buffer, and the cells were washed 3x in PBS. Splenocytes were prepared for flow cytometric analysis by staining cells 30 with anti-CD11c-biotin followed by streptavidin-APC, anti-CD8a-cychrome, and anti-CD4-FITC to assess DC populations.

In a separate experiment female BALB/c (N=3) mice were given i.p. 100 μ g hBCMA-Ig 1x/week for 4 weeks after which spleens were snap frozen in OCT using 2-methyl butane chilled on CO₂. Cryosections were cut and fixed in acetone. Sections were incubated with anti-CD11c-biotin followed by streptavidin-AP and substrate BCIP (Pierce) to visualize DCs, mAb MOMA-1 followed by anti-rat IgG-HRP (Jackson ImmunoResearch) and substrate 3,3' diaminobenzidine (Sigma, St. Louis MO, Cat. # D-1293) to visualize metallophilic macrophages, and anti-CD35-biotin followed by streptavidin AP and substrate (Alkaline Phosphatase Substrate Kit I, Vector cat#SK-5100) to visualize follicular dendritic cells(FDC).

Mice treated in vivo with either 20 μ g or 50 μ g of BCMA-Ig 1x/week for 4 weeks exhibited a significant decline (p<0.05 by Student's t test) in splenic CD11c+ DCs as compared to HuIgG and PBS-treated controls. This decline was seen for all CD11c+ DC populations examined: CD8a-CD4-, CD8a+CD4-, and CD8a-CD4+ (Figure 16, Table 14A).

Table 14A. BAFF-R-Ig treatment results in a reduction in the number of splenic DCs.

	PBS	HuIgG	<u>20 μg BCMA-Ig</u>	<u>50 μg BCMA-Ig</u>
Mean number of CD11+ DCs ($\times 10^6$) \pm SD				
CD8a-CD4-	0.81 \pm 0.15	0.49 \pm 0.07	0.26 \pm 0.04	0.35 \pm 0.05
CD8a+CD4-	0.36 \pm 0.02	0.35 \pm 0.07	0.16 \pm 0.02	0.2 \pm 0.02
CD8a-CD4+	0.92 \pm 0.02	0.84 \pm 0.15	0.4 \pm 0.06	0.55 \pm 0.04

This decline in splenic DCs, which are critical antigen presenting cells, may impact B cell activation, maturation and humoral immunity.

Frozen spleen sections were obtained from mice as described in Materials and Methods. BCMA-Ig-treated mice exhibited an atypical DC homing pattern when stained with anti-CD11c. DCs normally localize within the T cell area of the white pulp and within the marginal zone, with a concentration at the marginal zone bridging channels. However, DCs from BCMA-Ig-treated mice were found surrounding the perimeter of the marginal zone and few appeared to be able to migrate further within the white pulp (data not

shown). Therefore, blocking BAFF/BAFF-R interaction with soluble BAFF receptor appears to interfere with the homing pattern of DCs which may affect their ability to function as antigen presenting cells, thereby impacting B cell activation, maturation and humoral immunity. Furthermore, the spleens of BCMA-Ig-treated mice lacked CD35+ 5 FDCs as determined by immunohistochemistry (data not shown). Since FDCs function to present antigen to B cells within germinal centers (GC), lack of such cells could have a detrimental effect on GC structure and B cell affinity maturation.

It will be apparent to those skilled in the art that various modifications and variations 10 can be made in the polypeptides, compositions and methods of the invention without departing from the spirit or scope of the invention. Thus, it is intended that the present invention cover the modifications and variations of this invention provided that they come within the scope of the appended claims and their equivalents.

2025 RELEASE UNDER E.O. 14176
